

Temperature (Time?) Variation in Muon Detection Rate

Ian Hunt-Isaak

Partner: Corina Miner

December 10, 2015

Muon Sources

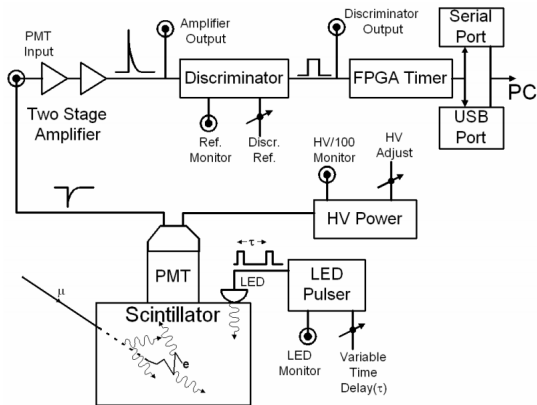

- Cosmic Rays \rightarrow Muons
- Sun Cosmic Rays \rightarrow Day/Night rate variation?

Confounding Effects

- Temperature affecting Detector
- Solar Activity

Experimental Setup

Left Diagram from [1]

Results - Hourly Temperature Variation

Hourly Temperature Variation with Muon Rate

Temperature Rate Correlation

Data Set	Slope	$\tilde{\chi}^2$
Low Threshold	-0.0114 ± 0.0028	4.681
High Threshold	-0.0053 ± 0.0017	1.099

200 mV Threshold

400 mV Threshold

Possible Explanations

- Threshold voltage drift
- Photomultiplier Gain
- Electronics Efficiency
- Noise
- Muons only come inside when its cold out

Next Steps...

- Fix Muon Rate Data collection
- Record Threshold voltage to try to detect drift
- Correct for temperature offset
- Better Data → More Complicated Temperature Dependence
